**Small RNA-directed reprogramming of gene
expression in plant-bacteria interactions**

Date: Friday, July 28th

Time: 12:00 - 1:00 pm Location:

Genomics Auditorium

Abstract: RNA silencing is an ancestral gene regulatory mechanism that plays a critical role in antiviral defense. This regulatory process controls several other biological processes, including resistance against phytopathogenic bacteria. Here, I will first present how small RNA-directed DNA methylation and active DNA demethylation transcriptionally regulate Arabidopsis immune-responsive genes during antibacterial defense. I will also report on the natural DNA methylation variation at active demethylase targets and on its consequence on gene expression. In the second part of my talk, I will present recent findings demonstrating the occurrence of a cross-kingdom RNA silencing phenomenon implicating the trafficking of active small RNAs from plant cells towards bacterial cells. In particular, I will describe the different plant extracellular small RNA species that are involved in this gene regulatory process.
